Two charts from the same invented table

Which display choices change an impression without changing the values?

My fictional table

Record all three values and label them invented.

My two scales

State each count-axis range and equal step size.

A numerical check

Find C - A on both charts. Did the underlying result change?

My display choice

Which display helps my stated purpose, and which labels must stay visible?

Keep it, change it or leave it here. Sharing is optional.
